Life Cycle of a frog

Do you know how Frogs grow? Read this story.

If you look in a pond in spring, you may see hundreds of blobs of jelly. Each round blob has a black dot inside. These are frogs' eggs, or frog spawn. After ten days, the little dots have grown into tiny tadpoles. They wriggle out of the jelly. Each one has a long tail. They can swim. They breathe with gills like fish. When they are five weeks old, they grow back legs which they kick to make them swim faster. When they are six weeks old, they grow lungs so they can breathe air, and at fifteen weeks the tadpoles have grown into frogs. Now they can jump and swim. Next year these frogs will lay

frog spawn
